LIFE HISTORY OF WIREWORM

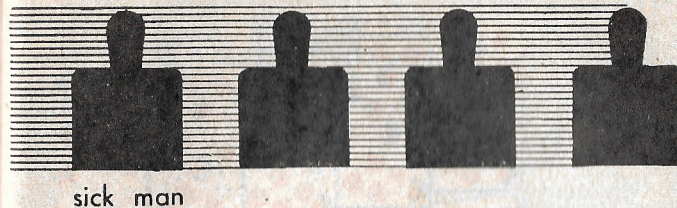

Wireworms live in the soil, feeding on plants. A wireworm eats and grows for four or five years. At the end of this time it is about 1 inch long. Usually at the end of its fourth year it pupates and emerges in the following spring as a click-beetle. The click-beetles mate and the females lay eggs from which young wireworms hatch. Most of the beetles are dead by autumn.
